Table 2: Details of the group restrictions**Table 3: Details of notes on verification of compliance**

Note No.	Note on verification of compliance
1	Verification of compliance by residual content per food contact surface area (QMA) pending the availability of an analytical method.
2	There is a risk that the SML or OML could be exceeded in fatty food simulants.
3	There is a risk that the migration of the substance deteriorates the organoleptic characteristics of the food in contact and then, that the final product does not comply with Article 3(1) c of the Framework
4	Compliance testing when there is a fat contact should be performed using saturated fatty food simulants as simulant D2.
5	Compliance testing when there is a fat contact should be performed using isooctane as substitute of simulant D2 (unstable).
6	Migration limit might be exceeded at very high temperature.
7	If testing in food is performed, Compliance testing shall be taken into account.
8	Verification of compliance by residual content per food contact surface area (QMA); QMA = 0,005 mg/6 dm ² .
9	Verification of compliance by residual content per food contact surface area (QMA) pending the availability of analytical method for migration testing. The ratio surface to quantity of food shall be lower than 2dm ² /kg.
10	Verification of compliance by residual content per food contact surface area (QMA) in case of reaction with food or simulant.
11	Only a method of analysis for the determination of the residual monomer in the treated filler is available.
12	There is a risk that the SML could be exceeded from polyolefins.
13	Only a method for determination of the content in polymer and a method for determination of the starting substances in food simulants are available.
14	There is a risk that the SML could be exceeded from plastics containing more than 0,5 % w/w of the substance.
15	There is a risk that the SML could be exceeded in contact with foods with high alcoholic content.
16	There is a risk that the SML could be exceeded from low-density polyethylene (LDPE) containing more than 0,3 % w/w of the substance when in contact with fatty foods
17	Only a method for determination of the residual content of the substance in the polymer is available
18	There is a risk that the SML could be exceeded from low-density polyethylene (LDPE)
19	There is a risk that the OML could be exceeded in direct contact with aqueous foods from ethylvinylalcohol (EVOH) and polyvinylalcohol (PVOH) copolymers

Table 4: Detailed specification on substances

FCM substance No	Detailed specification on the substance	
744	Definition	The copolymers are produced by the controlled fermentation of <i>Alcaligenes eutrophus</i> using mixtures of glucose and propanoic acid as carbon sources. The organism used has not been genetically engineered and has been derived from a single wildtype organism <i>Alcaligenes eutrophus</i> strain H16 NCIMB 10442. Master stocks of the organism are stored as freeze-dried ampoules. A submaster/ working stock is prepared from the master stock and stored in liquid nitrogen and used to prepare inocula for the fermenter. Fermenter samples will be examined daily both microscopically and for any changes in colonial morphology on a variety of agars at different temperatures. The copolymers are isolated from heat treatment bacteria by controlled digestion of the other cellular components, washing and drying. These copolymers are normally offered as formulated; melt formed granules containing additives such as nucleating agents, plasticisers, fillers, stabilisers and pigments which all conform to the general and individual specifications.
